List of papers
for the course 'Statistical Learning with Extreme Values', Master MVA, École Normale Supérieure Paris-Saclay

S. Clémençon,* A. Sabourin†

October 25, 2023

Instructions:

- Form groups of two.

- Each group picks a paper from the list here, or some other paper related to the topic, upon agreement of the instructor (send an email). Fill in the spreadsheet by writing your names in front of the paper you want to study. Only one group per paper, first arrived first served.

- Read and try to understand. Ask questions if you really don't, despite all your efforts.

- Write a short report (≤ 10 pages) explaining the main results of the paper. If possible implement the method proposed (or analysed) on a toy example. If this is a theoretical article, illustate the validity of the theoretical results on a toy example with simulated or baseline data (join the notebook). Send the report by email to both instructors one week before the presentations.

- Prepare a 15 min presentation (~ 10 slides max), following approximately your report, but shorter. Rehearse before D-day to make sure that you can explain what you have chosen to explain in 15 minutes. You cannot explain the whole paper, this is okay. Your presentation must be understandable by someone who has taken the course but not read the paper.

Good luck!
