

# HW1 - Algebra - Fall 2018

**Due date:** Friday, September 21.

## 1 Binary operations

Let  $S$  be a finite set, and let  $\bullet$  be a binary operation on  $S$  which is associative, and for which there exists a neutral element  $e$ . Let  $s$  in  $S$  be an element that has a “left-inverse”, i.e.

$$\exists t \in S, \quad t \bullet s = e.$$

We want to prove that  $t$  is also the “right-inverse” i.e.  $s \bullet t = e$ .

1. Consider the map  $\varphi : S \rightarrow S$  defined by

$$\varphi(r) := s \bullet r.$$

Show that it is one-to-one. (Hint: use the fact that  $s$  has a left inverse!!)

2. Since  $S$  is finite, what can you deduce about the map  $\varphi$ ?
3. Conclude that there exists a right-inverse for  $s$ , i.e. there exists  $u$  in  $S$  such that  $s \bullet u = e$ .
4. Show that  $t = u$  (use associativity).

Optional Can you find a counter-example if  $S$  is not finite?

## 2 Groups

Exercises 2, 7, 27, 31 (chapter 3).

## 3 Subgroups

Exercises 41, 45 (chapter 3).

## 4 Historical extra-credit

In a couple of sentences, what do you think of the life of Évariste Galois?
